Abstract

Online Bidding(bidding Game)

Introduction

The core concept of this online bidding website (Bidding Game) is to bring a whone new concept to the existing auction websites.In my website the company owns the website and the products that the company wishes to sell are listed on the website.The users who wish to participate in this bidding game have to purchase coins from the webiste(like 1 coin is 1 rupee).The thing that make my website different from the other existing ones is that products price start with 1 coin.

Those who are interested in the product should bid the product in exchange of the coins they have.Every time a user bids the product, the user loses the coins.At the closing time of the bidding,whomever has the highest bidding gets the product at that price and all others coins will turn as a profit for the company.

Apart form the bidding the website will act as an e-commerce website selling electronic products. Users can buy product off the website as msrp or they can wait for the product to go for bidding. For buying products directly form the website ,users doesn't need to buy coins from the website. The coin system is only for the bidding system.

1.Admin

- login
- Controls the time of bidding
- Product
- Price
- Bidding price
- Adds products
- Reports
- Mails

Admin Functionality:

Admin controls the time of bidding and the product that goes into bidding. He admits managers to add products .He also controls the price of t
